Subject: Personal Reflection

When we take on a project, we take it throughout its lifecycle. Only in this course has this sentiment been emphasized. During the semester, my partner and I failed to deliver on assignments because of issues that I thought were trivial: making Linux compatible executables, versioning the right libraries, and configuring virtual environments. I soon learned the importance of these the hard way. Predicting how much an assignment would take should take these into account, because they deserve as much attention as everything else and nothing matters if we can't even deliver to the end users.
